Harvington Hellebores® are hardy perennials with beautiful large flowers from December through to the end of March and dark green glossy evergreen foliage providing year round interest.

Easy to grow, excellent garden plants they reliably provide winter colour year after year. Our plants are selected for clarity of flower colour, attractive foliage, vigour and frost hardiness. Propagated and grown in the British Isles.

PLANTING ADVICE

1 Feed

Hellebores are hungry plants! Use compost or well-rotted manure when planting and as a mulch when the plants are established. The main growing periods are during the spring and autumn so mulching then is very beneficial. A general purpose fertiliser can also be applied in late winter. Additional liquid feed will also benefit the plants.

2 Leaves

Hellebore leaves are evergreen but do eventually look past their best, usually in late winter. They can then be cut off and new growth will take place. We advise leaving the leaves on as long as they look green and healthy.

3 Occasional problems

Helleborus niger plants sometimes suffer from fungal disease which causes black patches on their leaves. The fungi debilitate the plants which do not thrive. The easiest way to prevent this or treat if already present is to spray with a fungicide like liquid copper or Roseclear at the same time as you treat your roses. Control aphids with Roseclear or similar pesticide.

Point of sale – promotional header labels or bed strips are available – please request them when you order.

Pricing and pot size – please see price list enclosed for details of pot size and colour availability.
